

Mobile JKN Redesign – Elevating Digital Healthcare Experience

Document Version: 1.0

Role: UI/UX Designer & Product Thinker

Status: High-Fidelity Prototype Completed

About Mobile JKN

BPJS Kesehatan (Mobile JKN) is located in **Indonesia** and is happy to offer its expertise in **accessible national digital healthcare services**. Our tried and true system is based on over **50** years of cumulative experience shared between our **healthcare administrators and digital innovators**. I pride ourselves on setting up our **citizens** for success in **managing their health insurance ecosystem**, and I am sure that you will leave our **digital platform** more prepared than you have ever been before to **navigate your healthcare needs with confidence and ease**.

As the official digital extension of the National Health Insurance program, Mobile JKN represents our commitment to bridging the gap between complex bureaucratic processes and everyday user needs. Through continuous innovation, inclusive technology, and user-centric design, I ensure that over 200 million participants can effortlessly access their digital participant cards, secure medical queues, and seamlessly retrieve essential healthcare information anytime, anywhere.

Problem Statement

Based on the information architecture and user journey analysis, three core pain points frequently experienced by users of public service applications are identified:

- **Cognitive Overload:**

Dense administrative data regarding registration, rights, and obligations makes it difficult for users to find relevant information during urgent situations.

- **Perceived Performance Friction**

A cluttered and unorganized layout creates a perception that the application is "heavy" and slow, increasing user anxiety.

- **Lack Information Hierarchy**

Critical data points, such as digital membership status and ID numbers, are often buried or hidden under secondary information.

Design Solution & Strategy (Product Strategy)

The design approach focuses on **Simplification through Systemic Logic**, implementing four key UX strategies:

- **Modular Information Architecture**

Restructuring linear data into a *Card-Based UI* to allow users to scan essential information (like billing or facility locations) much more efficiently.

- **Progressive Disclosure**

Utilizing *Tabs* and *Accordions* to ensure technical details are only visible when needed, keeping the interface clean and approachable for non-technical users.

- **Visual Trust & Identity**

Redesigning the Digital Participant Card with high-contrast visual cues for the "Active" status, ensuring instant verification at healthcare facilities.

- **Empowering Self-Service**

Optimizing the FAQ and Service Channels to boost user autonomy and reduce the burden on physical help centers.

Feature & Functionality Requirements

Below is the breakdown of the product requirements implemented in the user interface:

A. Onboarding & Authentication

- **Splashscreen & Onboarding**

Visual onboarding introducing the modern Mobile JKN brand identity and highlighting the convenience of queue-free healthcare access.

- **Sign In / Sign Up Flow**

Simplified authentication and new account registration flows with clean forms to minimize input errors and improve conversion rates.

B. Core Navigation & Dashboard

- **Unified Main Dashboard**

A personalized home screen with a layout that prioritizes the primary action button, "Get in Line" (Queue).

- **Digital Participant Card**

A dedicated screen displaying the user's identity and active status in a high-contrast design format for optimal readability.

- **User Profile**

An intuitive page for personal data management and membership history tracking.

C. JKN Program Information Hub

An educational and regulatory transparency center structured using *Progressive Disclosure*:

- **Rights & Obligations**

Separately detailing participants' legal rights, administrative obligations, and healthcare facility standard operating procedures.

- **Contribution System**

Transparently displaying membership contribution details and billing tracking.

- **Healthcare Facility Locator**

Integration of a nearby healthcare facility search (hospitals/clinics) utilizing real-time location access.

- **Guides, Registration & Sanctions**

User guides, registration flows for new members, and explanations of administrative consequences for payment arrears.

D. Content & Engagement

- **Latest News & Smart Filter Articles**

Presenting the latest health news and information categorized through a Smart Filter, featuring a comfortable typographic hierarchy for reading.

E. System Permissions & Performance States

- **Simplified Permissions**

Transparent system permission confirmation interfaces, including Camera Access (for facial verification and QR scanning), Location Access (for facility locator), and Notifications (billing and medical reminders).

- **Security Protocols**

Dedicated screens for biometric authorization and data security protocols, available in two languages (ID & EN).

- **Loading Screens**

Visual feedback provided while fetching critical content to maintain users' psychological comfort (*perceived performance*).

How I Measure Success

Even though this is a high-fidelity prototype, I've designed it with clear goals in mind to make sure the app really works for people. Here is how I will know I am on the right track:

Speed and Ease of Use

The most important thing is that users can quickly find what they need. Our goal is for anyone to open their digital card or join a medical queue in less than 5 seconds.

Helpful Self-Service

By making information clearer in the app, I expect fewer people will need to call customer service for basic questions because they can easily find the answers themselves.

Happier Users

Ultimately, I want to see a significant jump in how satisfied people feel when using the app and how easy they find the overall experience.
